

## RHB-OSK ENERGY FUND (formerly known as OSK-UOB ENERGY FUND)

The Fund aims to achieve long term capital appreciation through an investment that is linked to the global energy sector.

### INVESTMENT STRATEGY

- 90% to 100% of NAV: Investments in Malaysian bonds, money market instruments, cash and deposits with financial institutions.
- Up to 10% of NAV: As capital payment for exposure to a derivative instrument in the form of a swap agreement that will provide the Fund with exposure to the global energy sector. With this capital payment, the Fund can have a notional amount of up to 100% of its NAV exposed to the Underlying which are linked to the global energy sector.

### INVESTOR PROFILE

#### This Fund Is Suitable For Investors Who:

- seek investment opportunities in the global energy sector;
- seek capital growth;
- have a long term investment horizon; and
- have an appetite for risk to gain higher returns.

**RHB-OSK ENERGY FUND (formerly known as OSK-UOB ENERGY FUND)**

The Fund aims to achieve long term capital appreciation through an investment that is linked to the global energy sector.

**MANAGER'S COMMENTS****MARKET REVIEW**

Brent crude oil prices started the month at \$108.07/bbl and ended higher at \$109.41/bbl. Moreover, WTI started the month at \$99.74/bbl before ending lower at \$102.71/bbl. Oil prices volatility declined sharply during the period under review as geopolitical tension between Russia and the Western World eased significantly as Russia and the Western World acknowledged a status-quo for the split of Ukraine between "Pro-Russians" and "Pro-Europeans". Moreover, oil prices benefited from improving macroeconomic data from China and the rest of EM. In fact, announcement of targeted stimulus program in China pushed oil prices back upward. Targeted macroeconomic stimulus and improved financing conditions for corporates are potential triggers for a sustainable economic rebound in China later this year.

In the US, while inventories are building up, WTI prices benefited from expectation of a sustained rebound of the economy after the winter's soft patch. Therefore, WTI spread to Brent shrunk from 8.33USD the previous month to 6.70USD.

Brent Price moved recently back into backwardation and is expected to remain in a structural backwardation for some time to come. In fact, the term structure for Brent is likely to be supported by 3 elements which are the most common for commodity market: supply, demand and inventories. First, OECD oil and petroleum product inventory levels outside the US remain exceptionally low, and will likely take a long time to rebuild, fostering backwardation. Second, we believe that Brent prices below \$100/bbl would likely elicit a strong demand response, allowing for a rapid absorption of any surplus. Third, the long-term cost of oil extraction has been anchored in a \$70 to \$90/bbl band for some time, a figure that allows for investment in Canadian Sands and US shale. These are all strong arguments for backwardation. Yet, after several quarters of underperformance, long-dated oil prices (i.e. the "back" of the futures price curve) have outperformed near-dated prices. On the other hand, while the WTI has recently moved into backwardation, mainly due to lower inventories at Cushing after new pipelines came on stream and debottleneck Cushing inventories, we don't see this as a sustainable situation.

In fact, while we believe the term structure of the Brent market will remain in backwardation for some time, we are more concerned about the pricing structure for WTI for a number of reasons. First and foremost, WTI backwardation seems extreme over the next 18 months, averaging \$0.71/bbl per month from July 2014 to January 2016. The ongoing ramp up in crude oil production in the United States into the second half of the year could ultimately result in higher inventories at Cushing and therefore pressure WTI prices.

We maintain a bearish bias on Brent due to a robust USD, fast non-OPEC supply growth, and a muted EM demand picture. We also retain a much more cautious stance on WTI due to high levels of US crude oil stocks and a firm domestic production outlook. We still see meaningful downside risks and project next year prices to average \$90/bbl. Structurally, WTI prices are likely to see their discount to Brent to increase as the US domestic production will continue to rise and pipeline debottlenecking by H2 2014 should increase flow to Cushing, pressuring structurally prices downward.

In conclusion, we think that Brent is likely to face some downside risks in heading into H2 2014 on returning supply and weaker crude demand. Moreover, the earlier than expected QE tapering by the FED and its direct effect on continued pressure on EM Currencies and yields could keep energy prices in local currencies in major EM exceedingly high, putting downward pressure on demand growth which will already be impacted by slower GDP growth. Therefore, we can't rule out that Brent prices will revisit the \$100 per barrel level in 2014. In the US, the WTI could face additional downward pressures from potential transportation, storage, and refining bottlenecks. With US domestic production ramps up seasonally in the second half of the year and some refiners in the GOM shut down for maintenance in Q3, WTI could move back into contango, pushing prices downward. Therefore, we still see a risk of \$80/bbl or lower for the Oklahoma grade at some point over the next 12-24 months on the back of potential midstream and downstream bottlenecks.

**DISCLAIMER:**

Based on the fund's portfolio returns as at 15 May 2014, the Volatility Factor (VF) for this fund is 14.8 and is classified as "Very High". (source: Lipper) "Very High" includes funds with VF that are above 13.1 (source: Lipper). The VF means there is a possibility for the fund in generating an upside return or downside return around this VF. The Volatility Class (VC) is assigned by Lipper based on quintile ranks of VF for qualified funds. VF is subject to monthly revision and VC will be revised every six months. The fund's portfolio may have changed since this date and there is no guarantee that the fund will continue to have the same VF or VC in the future. Presently, only funds launched in the market for at least 36 months will display the VF and its VC. The VC referred to was dated 31 December 2013 which is calculated once every six months and is valid until its next calculation date, i.e. 30 June 2014.

A Product Highlights Sheet ("PHS") highlighting the key features and risks of the Fund is available and investors have the right to request for a PHS. Investors are advised to obtain, read and understand the PHS and the contents of the Master Prospectus dated 1 December 2013 and its supplementary(ies) (if any) ("the Master Prospectus") before investing. The Master Prospectus has been registered with the Securities Commission Malaysia who takes no responsibility for its contents. Amongst others, investors should consider the fees and charges involved. Investors should also note that the price of units and distributions payable, if any, may go down as well as up. Where a distribution is declared, investors are advised that following the issue of additional units/distribution, the NAV per unit will be reduced from cum-distribution NAV to ex-distribution NAV. Any issue of units to which the Master Prospectus relates will only be made on receipt of a form of application referred to in the Master Prospectus. For more details, please call 1-800-88-3175 for a copy of the PHS and the Master Prospectus or collect one from any of our branches or authorised distributors.

The Manager wishes to highlight the specific risks of the Fund are credit/default risk, interest rate risk, counterparty credit risk associated with derivatives, derivatives risk, legal/regulatory risk, sector risk, currency risk, management risk, risk linked to the MSCI World Energy Index, returns are not guaranteed and risks relating to JPMCCI Energy Excess Return Index and the Contag Indices. These risks and other general risks are elaborated in the Master Prospectus.
